AI KNOWLEDGE HUB - CONTROLLED PDF EVALUATION

Document: Northstar Data Platform (fictional project)

Northstar Data Platform manages sales, inventory, and customer records.

The project was started in 2024.

The backend is built with Python and FastAPI.

The frontend is built with React.

The main relational database is PostgreSQL.

The system collects data from several internal business applications.

Business users can review consolidated reports in one interface.

All organizations, dates, and specifications here are fictional.

Each page deliberately contains facts for citation and page tests.

PAGE 2 / 4 - SYSTEM ARCHITECTURE

Controlled test document - text selectable, 4 pages

The platform has three layers: user interface, API, and database.

The React user interface displays reports and lets staff manage records.

The FastAPI service processes HTTP requests and business rules.

PostgreSQL stores customers, orders, products, and inventory entries.

Customer and order records are connected using customer_id.

JWT tokens are used to authenticate registered users.

Redis is NOT used in the current architecture.

No application-level response cache has been implemented yet.

Reports are requested through authenticated API endpoints.

The platform does not currently offer a public developer API.

PAGE 3 / 4 - PERFORMANCE AND SECURITY

Controlled test document - text selectable, 4 pages

The target API response time is less than 200 milliseconds.

The platform is designed for 150 concurrent active users.

Authentication uses JSON Web Tokens (JWT).

Passwords are never stored in plain text.

Database backups run every day at 02:30 UTC.

Database backup copies are retained for 14 days.

Backup access is restricted to the operations team.

Users can view only the records allowed by their permissions.

An audit log records important administrative changes.

Performance and availability figures are design targets, not test results.

PAGE 4 / 4 - RELEASE AND ROADMAP

Controlled test document - text selectable, 4 pages

The first test deployment took place on March 15, 2025.

The application is packaged and operated with Docker containers.

The next release plans to add CSV export.

Advanced reporting and email notifications are also planned.

No decision has been made about a mobile application.

The cloud hosting provider is not specified in this document.

The product has no announced public launch date.

All information in this file is for controlled RAG testing.

Expected behavior: answer only questions supported by these pages.

Questions about unknown provider names should receive abstention.
